New division and new home for Applied Automation

Rapidly growing south west manufacturer Applied Automation (UK) Ltd is launching a new division and moving to a new home.

The company has bought a new factory that is more than twice the size of its current site. The move coincides with the launch of the Applied Industrial Systems division. It will specialise in factory and materials handling equipment, including a new line of conveyors.

The division will encompass the hugely successful MayTec team that has achieved its seventh year of consecutive growth, seeing a whopping 35% increase in sales in 2014/15. The team supplies aluminium profiles and profile assemblies such as work benches and machine guards. New product ranges will include pipe and joint systems for lean manufacturing and factory equipment, including trolleys and shelving, and the Carryline flexible plastic chain conveyors.

David Rowe, Managing Director, said: "The MayTec profile system is hugely popular and we needed more space for the team, but we also identified an opportunity to increase the range. The pipe and joint system is incredibly versatile and we're excited to have signed a national agreement to supply the Carryline conveyor system. We expect 2015/16 to see a further growth in sales, especially with these new product lines and the additional processing and stores capacity."

"We're also delighted to be taking the new Industrial Systems division to the PPMA Show later this year where we can showcase these products."
